### Rankings

- **Global Ranking**: #18 Tallest in the World
- **Regional Ranking**: #2 Tallest in North America
- **National Ranking**: #2 Tallest in United States
- **City Ranking**: #1 Tallest in Chicago

### Original Companies Involved

#### Owner
- **Current**: The Blackstone Group L.P.
- **Past**: The Moinian Group

#### Developer
- Sears Roebuck and Company

#### Architect
- **Design**: Skidmore, Owings & Merrill LLP

#### Structural Engineer
- **Design**: Skidmore, Owings & Merrill LLP

#### MEP Engineer
- **Design**: Jaros, Baum & Bolles

#### Main Contractor
- Morse Diesel International

#### Other Consultant
- **Façade**: Enclos Corp.
- **Fire**: Schirmer Engineering Corporation
- **Property Management**: CBRE; EQ Office
- **Vertical Transportation**: Jaros, Baum & Bolles; Van Deusen & Associates
- **Wind**: Alan G. Davenport Wind Engineering Group

#### Material Supplier
- **Cladding**: Cupples
- **Elevator**: Schindler
- **Sealants**: Dow Corning Corporation
- **Steel**: American Bridge Company

### Retrofit Companies Involved

#### Owner/Developer
- The Blackstone Group L.P.

#### Architect
- **Design**: Gensler
About Willis Tower

The Willis Tower (formerly Sears Tower) in Chicago, with its signature black aluminum and bronze-tinted glare-reducing glass, was the tallest building in the world for nearly 25 years. Completed in 1974, Willis Tower set the standard for supertall skyscrapers around the globe, both in its innovative design and graceful styling. With approximately 424,000 square meters of gross floor area, the building is comparatively large for its height, with its foundation and the first 50 floors taking up an entire city block before the building begins to narrow.

The step-back design of the structure was designed by the architects as a direct result of Sears’ space requirements. The designers were required to develop a building that incorporated not only very large office floors, which were necessary to Sears’ operation, but also a variety of smaller floors which would be more suitable for tenants requiring less floor area. These requirements resulted in a bundled tube structure, the first of its kind. This innovative design was not only structurally efficient, but it also managed to be economical as well. It has proven to be a remarkably influential design typology, and has been used in most supertall buildings built since the Willis Tower, including the Burj Khalifa.

An assortment of features has kept the tower active, inviting, and efficient over its operational life. An undulating Alexander Calder sculpture greets office workers in the west lobby. Meanwhile, a 2009 addition to the observation deck affords visitors with vertigo-inducing views of Chicago via “The Ledge,” a series of boxes with transparent floors that extrude from the top of the building. Although the Willis Tower was built in an age before sustainable design matured, the building’s owners have recently implemented several sustainable elements, including low-flow fixtures that conserve more than 38 million liters of water annually, and high-efficiency lighting systems that help curb electrical loads.
